PROFILE

Software Developer specializing in the design of modular and scalable architectures using TypeScript (NestJS) and Java (Spring) ecosystems. I have a proven track record of transforming complex business requirements into robust, well-documented, and maintainable technical solutions.

Expert in developing high-impact enterprise systems, applying advanced design patterns to ensure data integrity and security. My experience ranges from creating ERP platforms and management tools with critical integrations to automating deployment cycles and optimizing production environments in the cloud. I focus on building efficient software that solves real-world problems, always ensuring long-term performance and scalability.

EMPLOYMENT HISTORY

❖ Freelance software developer, Self-Employed Sept 2019 — Present

- Designed and implemented backend architectures using TypeScript, NestJS, and Prisma with a focus on extensibility.
- Applied Builder and Specification patterns to refactor complex audit filtering and business logic.
- Developed a business management system with an integrated social network, ensuring modular folder structures and semantic DTO validation.
- Created Discord bots with custom functionalities to automate workflows and enhance community engagement.
- Collaborated closely with UI/UX designers, ensuring defensive validation and seamless integration of user interfaces.
- Troubleshoot infrastructure issues (Nginx, Certbot, Docker, Google Cloud) with modular, stepwise solutions for reproducibility.
- Implemented automated CI/CD deployment using GitHub Actions, ensuring continuous integrations and reliable deliveries.

❖ Fullstack Developer, Dream Junk Studios Sept 2022 — Aug 2024

- Led frontend and backend development across multiple projects simultaneously, balancing scalability and maintainability.
- Integrated Swagger documentation and DTO validation to improve clarity and developer onboarding.
- Implemented proration (prorratio) and renewal logic for monthly payment systems, ensuring fairness and operational clarity.
- Collaborated with cross-functional teams to deliver user interfaces with semantic precision and defensive coding practices.
- Resolved conflicts in development pipelines by applying modular troubleshooting and reproducibility strategies.
- Developed promotional landing pages with optimized builds, ensuring silent and future-proof hardware performance.

TECHNOLOGIES

Java	Socket.io
TypeScript	MongoDB
NestJs	MySQL
Spring Framework	PrismaORM

SKILLS

❖ Programming Languages & Frameworks

- TypeScript & NestJS: My primary tools for building extensible and modular backends.
- Java & Spring Framework: Experience in developing solid enterprise-level architectures.
- JavaScript (Node.js): Proficiency in development using Node.js and Express.js.
- Frontend Development: Building interfaces with React.js, Redux, TailwindCSS, Sass, and CSS3.
- Other Languages: Technical knowledge in C and Python.

❖ Databases & ORM

- Prisma ORM: Specialized use of this ORM for efficient data modeling and management in TypeScript environments.
- Hibernate & Spring Data JPA: Experience using Java-based ORMs for managing relational data within the Spring Framework.
- Liquibase: Knowledge of using database schema change management tools to maintain version control for database migrations.
- Relational Databases: Experience working with MySQL, PostgreSQL and SQLite.
- NoSQL: Implementing storage solutions with MongoDB.

❖ Infrastructure & DevOps

- CI/CD: Automating deployments and continuous integration tasks using GitHub Actions.
- Containerization: Managing isolated and reproducible environments using Docker.
- Web Servers: Configuring and managing Nginx servers and Certbot for SSL.
- Cloud & Tools: Experience with Google Cloud, AWS, Cloudflare, and Ubuntu systems.

❖ Specialized Development

- Desktop Apps: Developing cross-platform applications (desktop/web) using ElectronJs.
- Discord Automation: Creating custom bots (Discord.js) to optimize workflows and community engagement.
- Real-time: Implementing bidirectional real-time communication systems with websockets.

EDUCATION

❖ U.P.T.N.M 'Ludovico Silva' Mar 2025 — Present
Ing. Informática

❖ U.P.T.N.M 'Ludovico Silva' Oct 2022 — Feb 2025
T.S.U en Informática

LANGUAGES

English B2 Spanish *Native speaker*

PROJECTS

❖ Gestini

Sept 2024 — Present

Gestini is a desktop and web application for business management, offering exhaustive control over inventory, warehouses, suppliers, and customers. It features key metric tracking, sales management, and a billing system integrated with **AFIP** (Argentina’s tax authority). Additionally, it includes HR management, role-based access control, and support for multi-branch company structures to optimize operational administration.

Planning & Development

The project was built following an **Agile** methodology to ensure continuous improvement based on user feedback.

I worked with an architecture that supports both desktop and web applications using Electron. I worked with databases like MySQL and MongoDB, using Spring and Java for the backend. I also configured multiple environments (production and development) and automated deployment tasks (CI/CD) with GitHub Actions. I collaborated closely with designers to build interfaces.

The planning focused on

- Designing a modular schema for inventory, sales, HR, and billing.
- Developing a multi-tenant architecture for managing multiple branches.
- Implementing a robust security layer for role management and legal documentation.

Key Features

- **Inventory & Warehouse Management:** Real-time stock tracking with multi-location support for inflows and outflows.
- **Supplier & Customer CRM:** Detailed records, transaction histories, and performance metrics.
- **Sales & Analytics:** Data-driven tools for generating reports and tracking business KPIs.
- **Fiscal Integration:** Automated electronic invoicing via direct **AFIP API** integration.
- **HR Module:** Employee registration, role assignment, and legal document management.
- **Security & UX:** Robust authentication, password recovery, and optimized local session management.
- **Data Portability:** Seamless import and export capabilities for **Word, PDF, and Excel** formats.

Since its implementation, **Gestini** ERP significantly improved the operational efficiency of the companies using it. Users report a reduction in inventory and sales management times, as well as an increase in the accuracy of generated reports.

The system has enabled companies to comply with tax regulations more efficiently by facilitating the issuance of electronic invoices directly through AFIP. Furthermore, the platform has seen high user adoption, with users valuing the application's simplicity and effectiveness in their daily work. Gestini ERP has established itself as a key tool for business management, allowing companies to optimize their operations and improve internal communication, as well as communication with suppliers and customers.

❖ Detail Plumbing

Apr 2024 — Feb 2025

Detail Plumbing is a comprehensive management platform (ERP) specifically designed for architecture firms, enabling precise estimations directly on PDF blueprints. This system provides users with advanced tools to upload documents, trace lines and areas over plans, and efficiently manage user roles and permissions, thereby optimizing workflow and collaboration on architectural projects.

Planning & Development

The development of Detail Plumbing began with an in-depth analysis of the specific needs within the architectural sector. Interviews were conducted with architectural firms and industry professionals to identify key challenges during the budgeting stage. Based on these insights, a solution was designed focusing on the following core functionalities:

- PDF blueprint uploading and visualization.
- On-plan measurement and tracing tools.
- User and role management for collaboration across departments or projects.
- Automated estimation and budget generation based on measurements.

Key Features

- **PDF Visualization and Tracing:** Users can upload PDF blueprints and use intuitive tools to trace lines, measure distances, areas, and key elements directly onto the documents.

- **Estimation Management:** The system converts measurements into automated estimates for materials, time, and costs, generating detailed budgets.
- **Role and User Management:** Includes a robust permission system that allows assigning specific functions to each user according to their role (architect, estimator, project manager, etc.).
- **Project History and Versioning:** Maintains a change log per user, blueprint versions, and budget revisions, ensuring full traceability and process control.

Since its implementation, **Detail Plumbing** has enabled architecture firms to significantly improve accuracy and speed in budget generation. Teams have reported enhanced collaboration between roles, a lower margin of error in estimations, and clear traceability throughout the project lifecycle. The direct integration with PDF blueprints has reduced operational times and improved competitiveness compared to manual or fragmented processes.

❖ Litium C.A Jul 2025 — Feb 2026

Litium Shop is an e-commerce web system designed for the micro-enterprise "Litium C.A." to digitize the sale of household appliances and technological goods. The platform centralizes inventory management and customer interactions, providing a secure and efficient digital environment to transition from traditional manual sales to a modern online storefront.

Planning and Development

The project began with a requirements analysis and a participatory diagnosis at Litium C.A. in Maturín. This phase allowed the team to prioritize critical functionalities using the SCRUM methodology to address operational bottlenecks, focusing on:

- Transitioning from manual sales via messaging apps to an automated web platform.
- Developing a scalable architecture for real-time inventory and category management.
- Designing a responsive user interface accessible from any modern web browser.
- Implementing secure modules for transaction tracking and digital invoicing.

Key Features

- **Dynamic Catalog:** An organized display of products with detailed technical specifications and categories.
- **Shopping Cart & Reservations:** Allows users to manage multiple items and reserve products with flexible payment options.
- **CRM & Interaction:** Integrated direct chat with administrators and a community comment system for product reviews.
- **Admin Dashboard:** A centralized control panel for managing stock, supervising sales reports, and updating content.

Since its implementation at Litium C.A., Litium Shop has transformed the company’s business model. By replacing manual workflows with a digital automated system, the enterprise expanded its market reach to a national level, significantly reduced customer response times, and increased transaction accuracy through digital record-keeping.

❖ Vitalcare Feb 2024 — Sept 2024

Vitalcare is a desktop system designed to optimize the management of medical records, appointments, and patient files. The platform offers advanced modules to control patient data, healthcare staff, and historical archives, centralizing information to streamline both clinical and administrative decision-making.

Planning and Development

The project began with a requirements analysis at the "**Dr. Manuel Núñez Tovar**" **University Hospital**. This diagnostic phase allowed the team to prioritize critical functionalities to address the hospital's bottlenecks, focusing on:

- Digitization and secure storage of patient records.
- Scheduling and tracking of medical appointments.
- Profile management for patients and medical staff.
- Inventory control for supplies and medicines.

Key Features

- **File Viewer:** Quick access to patients' historical documentation.
- **Advanced Search:** Immediate location of records using intelligent filters.
- **Administrative Dashboard:** Real-time visualization of operational metrics and summaries.
- **Role Management:** Efficient permission handling for medical and administrative staff.

Since its implementation at the "Dr. Manuel Núñez Tovar" Hospital, Vitalcare has transformed the facility's

operations. By replacing manual paper-based processes with a digital workflow, response times were drastically reduced, the margin of error was minimized, and the traceability of every consultation and supply was optimize

❖ SIGE Sept 2022 — Mar 2024

SIGE is a business management platform designed for organizations to manage their projects and tasks comprehensively. The system combines operational efficiency with social collaboration tools, including a community section that allows for post creation and real-time communication via chat.

Planning and Development

The project was born from the need to centralize team management within a single digital environment. The development focused on unifying technical workflows with internal communication, prioritizing:

- A scalable architecture for managing multiple simultaneous projects.
- Implementation of instant messaging systems to reduce reliance on emails.
- Design of an intuitive interface oriented toward productivity and task tracking.

Key Features

- **Comprehensive Project Management:** Tools for the assignment, monitoring, and fulfillment of objectives.
- **Dynamic Community:** A dedicated space for collaborators to share updates and knowledge through posts.
- **Real-Time Chat:** A direct communication system to speed up decision-making among team members.
- **Task Control:** Detailed organization of activities with progress status and deadlines.

With the implementation of SIGE, companies achieve a 360-degree view of their operations. The integration of the community and chat features has strengthened the collaborative culture, while the project module has enabled more precise task execution, eliminating information fragmentation and improving the organization's overall performance

❖ Marvig Jan 2020 — Mar 2021

Marvig is a specialized hotel reservation platform designed to optimize the interaction between the establishment and its guests. The system provides a dual solution: an intuitive interface for clients to manage their stays and a robust administrative panel for the hotel's operational control.

Planning and Development

The development of Marvig focused on digitizing the complete reservation lifecycle, from initial availability to check-out. The main objectives of the project were:

- Centralizing room inventory to prevent duplications or occupancy errors.
- Automating the booking process to improve the end-user experience.
- Providing the administration with a clear, real-time view of the hotel's status.

Key Features

- **Reservation Management:** An automated system for clients to easily select dates, room types, and confirm their stays.
- **Detailed Inventory:** Exhaustive control of all rooms, allowing administrators to manage categories, pricing, and availability.
- **Administrative Dashboard:** Tools to monitor incoming reservations, cancellations, and guest profiles within a single platform.
- **Guest Tracking:** Historical records of clients to offer personalized service and improve customer loyalty.

Since its implementation, Marvig has enabled hotels to increase their operational efficiency and reduce manual workload. The platform has significantly improved inventory management accuracy, eliminating the risk of overbooking and providing a seamless user experience that results in higher conversion rates and customer satisfaction.
